This interface is used after video chat occurs

Chat participants. Thumbnail is generated for equal time intervals or per agenda item

Note markers are stacked and color coded to help users detect patterns in the video so they can quickly find important moments in the conversation

The thickness of the borders are determined by the duration the user holds down the corresponding key. The longer the key is held the larger the border will be

These keys are used during the video chat to insert a note marker into the video, the note marker can later be annotated. The note markers from all chat participants are recorded with exception to private note markers

The double frame indicates a private note. This note is only visible to the person that created. The note doesn't exist from the other users perspective

On Mouse Rollover, the images pull apart and the cooresponding annotation appears with the image the mouse is over.

The image the mouse is over moves to the front, floating above the other images

! The sequencing of the images really help it

The annotation appears over the person the comment is aimed at, and is vertically aligned with its cooresponding thumbnail

⏮ ⏪ ⏩ ⏭

On Mouse Press, the timeline row selected swaps positions with the center row

When the mouse is pressed on a stack of notes, the stack separates and is ordered by note type, and chronology, and the thumbnail is positioned by who the note is addressed to. The notes sit atop of the person it addresses.

When a particular stack is selected, the timeline becomes disabled, to reactivate the timeline, the user can click on any disabled area.

? Why is it so abstracted

(I like the diagram

In this view, on rollover the thumbnails display movie controls, such as play, stop and pause.

! It needs to be splayed out

The video viewer is synchronized to display the point in the video where the user investigates the timeline.
